

Reduce adjudication timelines

Merative Clinical Development Endpoint Adjudication

Endpoint adjudication gives sites, coordinators and adjudicators online access to the content they need to assess clinical trial endpoints during the adjudication process. Avoid the complexity of operational and workflow challenges with paperless workflow coordination and online dossier creation to prevent lost documents.

Document management

- Clearly define documents required based on event type
- Leverage document redaction, annotation and translation tools
- Compile an electronic dossier as a PDF chapter book with table of contents packages for adjudicators

Data integration

Map and import data from any source – for example, your preferred EDC - with no programming required using the data migrator. This includes:

- Create and apply filters and formatters to the data source to fit your EAM design
- Define recurring import frequency to keep data up to date

Single dashboard

- Manage every aspect of adjudication, from start to finish
- Combine workflows and endpoint management in a single workspace
- Enable authorized users, such as Critical Events Committee (CEC), to access original study documents and essential workflows – including paired consensus, parallel review, expert review and direct communications
- For each study, tailor the level of automation you desire. For example - automatic assignment of adjudicators based on workload, automated status update based on latest actions, automated detection of agreement and disagreement, automated generation of final outcome, etc.

Global language support

Accelerate your translation process for any uploaded source documents thanks to the automated send and receive workflow between Merative® Clinical Development and your translation vendor

Automated worklists and notifications

- Monitor outstanding tasks related to event coordination workflow and team progress
- Setup automatic alerts when documents are ready for review

Reporting and Analytics

- Includes multiple adjudication reports including adjudication tracker, adjudication phase distribution, adjudicator workload and missing source documents
- Event insights include reports on event type breakdown and event aging
